1. Graduate Seminar Series

Graduate seminar series is a regular features of at USPCAS-W. These seminars are usually organized on weekly basis. The main aim of these seminars are to keep students and faculty updated about the latest advancements in the field of research, facts and trends in water and related sectors. Experts from all over the country are invited to deliver lectures & presentations and give talks on the most emerging water related issues and the best practices adopted worldwide in addressing those issues.

So far; the center has organized following seminars;

S. No.	Topic	Speaker(s)/Presenter(s)	Date
1	Spate Irrigation: Potential and Challenges in Sindh	Mr. Karim Nawaz Baloch, Water Expert from Balochistan Dr. Kamran Ansari, USPCAS-W Dr. Altaf Ali Siyal, USPCAS-W	4/9/2015
2	Health, Safety and Environment	Engr. Nizamuddin Domki, HSE Trainer	18/09/2015
3	Impact of Climate Change on Water Resources of Sindh Province	Senator Nisar A. Memon Dr. Ghulam Rasul, Pakistan Meteorological Department	5/11/2015
4	Water quality around us: Overview of situation in Hyderabad and Tharparkar	Prof. Dr. Muhammad Iqbal Bhangar , University of Karachi	12/11/2015
5	Water: Resources , Issues and Management	Prof. Dr. Iqbal Ahmed Panhwar, Bahria University Karachi	11/12/2015
6	How to review research paper & write a research proposal	Dr. Sajjad Ahmad, University of Nevada, Los Vegas USA	22/01/2016
7	Empowering the Irrigation Reforming Institutions in Sindh	Mr. Nazeer A. Essani General Manager (Transition) Sindh Irrigation Drainage Authority	29-1-2016
8	Sustainable Development and WEF Nexus		12-02-2016

9	"Linkages between Engineering Research and Entrepreneurship"	Dr. Shahid Qureshi IBA Sukkur	01-04-2016
10	Hydrology and water resources engineering	Dr. Habib ur Rehman	29-04-2016
11	Urban climate research: application of remote sensing and GIS	Dr. Haroon Stephen Assistant Professor Civil and Environmental Engineering Director GIS and Remote Sensing Core Lab University of Nevada, Las Vegas	06-06-2016
12	GLOF mapping and risk assessment in Hunza river basin using geospatial techniques	Dr. Arjumand Zaidi Assistant Professor National Centre for Remote Sensing & Geo Informatics Institute of Space Technology	2-9-2016

2. Speaker's profile

Dr. Arjumand Zaidi

Dr. Arjumand Zaidi is PhD in Information Technology from School of Information Technology, George Mason University, Fairfax, Virginia. USA. Dr. Zaidi has extensive experience in the field of environmental evaluation and decision making. Her research interests include optimization and modeling of water resources, environmental and disaster management systems. Most of her research work deals in environmental decision making with the help of various numerical techniques and Geographical Information Systems (GIS) using satellite data.

3. GLOF mapping and risk assessment in Hunza river basin using geospatial techniques

On Friday January 29, 2016, Dr. Arjumand Zaidi, Senior research fellow USPCAS-W, delivered the seminar with on **"GLOF mapping and risk assessment in Hunza river basin using geospatial techniques"**.

Dr. Arjumand Zaidi – the speaker of the seminar started her lecture while discussing about the dangers of glaciers that are often responsible of forming lakes at their termini. Having outburst potential, these lakes

could turn to be dangerous. In Pakistan, at Hindu Kush Himalayas (HKH) region, a number of dangerous glacier lakes have been created in the recent past. Rupturing of the dangerous lakes has caused severe flooding in the region called “GLACIAL LAKE OUTBURST FLOODING (GLOF)”. The lecture was based on a study conducted for the International Centre for Integrated Mountain Development (ICIMOD) on Vulnerability Assessment for Potential Glacial Lakes Outburst Floods (GLOFs) events in Passu and Bagrot Valley. The lecture was an effort to use satellite data for glacier lake monitoring and flood extent modeling. An addition to that, speaker attempted to identify the GLOF hazard areas in Hunza Basin.

In later parts of her presentation she talked specifically about the terrain surrounding the Hunza River. The speaker told the students about the combination of GIS and ArcGIS that she had used for her research. The speaker elaborated that the Passu Lake located at the terminus of Passu glacier in Hunza Basin is a dangerous glacier lake with a past history of several GLOFs. HEC- GeoRAS and HEC-RAS were used to model an anticipated flooding in Hunza River due to Passu Lake outburst. Flood hazard mapping predicts the possible flood

extent may be used to determine floodplain zones. Flood hazard map prepared in this study were presented to develop an understanding of the impact of such disasters in order to lower the risk of the vulnerable communities.

4. Annexure: Presentation

Background

- Global warming causing alteration in natural phenomenon including
 - Glacier retreat
 - Creation of lakes on glaciers' terminus
- These lakes are very unstable and burst resulting in a discharge of huge amounts of water and debris called Glacial Lake Outburst Flood (GLOF)
 - Causing destruction of downstream valleys
- GLOF is a common problem in the Hindu Kush - Himalayan (HKH) countries - Bhutan, China, India, Nepal and Pakistan (ICIMOD)

What is Glacial Lake Outburst Flood (GLOF)?

- Occurs when dam containing a glacial lake fails
- GLOFs may be developed abruptly in a lake with no prior history of outburst
- Therefore, magnitude and frequency can not be predicted using standard statistical methods

How to reduce potential GLOF impact?

- Continuous monitoring of potentially dangerous lakes
 - Spatial
 - Temporal

Problem?

- Due to remote locations of these lakes continuous monitoring is a **challenge!!!!**

Role of Geospatial Techniques?

- Using RS and GIS techniques, status of glaciers and glacier lakes can be continuously monitored
- Hydraulic modeling – for hazard mapping

Hydraulic Modeling

- Functions
 - Pre- processing of GIS data
 - Model Execution
 - Post-processing/visualization of results
- Use
 - Floodplain management
 - Disaster Management
 - Flood insurance studies

USAID
FROM THE AMERICAN PEOPLE

U.S.-Pakistan Centers for Advanced Studies in Water

HEC-RAS

- Hydraulic model developed by
 - Hydrologic Engineering Center (HEC), U.S. Army Corps of Engineer
- Types of River Analysis
 - Performs one dimensional steady and non-steady flow river hydraulics calculations
 - Computes water surface elevation along the channels
- Results are transferred back to GIS

HEC-GeoRAS

- Extension of ArcGIS to extract river geometry
- Preprocessor to export geometry data to HEC-RAS
- Post Processor for data imported from HEC-RAS

Case Study

- Watershed delineation
- Discharge calculation
- Simulation model setup
- Simulation run
- Flood maps

Estimation of Probable Maximum Discharge

Watershed Delineation

Lake Volume & Discharge

SN	Relation	Reference
1	$Q_{max} = 0.00077V^{1.017}$	Huggel 2002
2	$*Q_{max} = 0.00013PE^{0.60}$	Costa and Schuster 1988
3	$Q_{max} = 0.0048V^{0.896}$	Popov 1991
4	$**Q_{max} = 2V/t$	Huggel 2002

*PE = 9800 x dam height (h in m) x V
** t = 1000 sec, duration of outburst

- Modeled Relationships between Lake volume and discharge in Moraine Dam Failure

Utilizing Arc Hydro

$V = m^3$, $Q_{max} = m^3/sec$

U.S.-Pakistan Centers for Advanced Studies in Water

Lake Volume and Area

SN	Relation	Reference
1	$V = 0.035A^{1.5}$	Evans 1986
2	$V = 0.104A^{1.42}$	Huggel 2002

Modeled relationship between lake area and volume

Passu Lake Area

$A = m^2, V = m^3$

❖ Lake area derived from April 2005 Google Earth image. 12.53 hac (125,300 m²) is used in this analysis

GLOF Discharge

Lake Volume

- $V = 0.104A^{1.42}$ Huggel 2002
- $V = 0.104 \times (125,300)^{1.42}$
- $V = 1.8 \times 10^6 m^3$

Probable Maximum Discharge

- $Q_{max} = 0.00077 V^{1.017}$ Huggel 2002
- $Q_{max} = 0.00077 \times (1.8 \times 10^6)^{1.017}$
- $Q_{max} = 1,774 m^3/sec$
- Total Flow = Q_{max} + River Discharge

River Discharge

Recorded Flow at Dainyar = 323 m³/s with 69 m³/s Standard Deviation (SD)

Location	Catchment Area (Km ²)	Discharge Mean Annual (m ³ /s)	Discharge Mean+1SD (m ³ /s) CI=84%	Discharge Mean+3SD (m ³ /s) CI=99.85%	Comment
Hunza River at Dainyar Bridge	13,733	323	392	530	Measured
Hunza River at Passu	9,082	214	259	351	Estimated

Flow Profiles Selected for Simulation

Flow Profile	Description	Total Flow (m ³ /s)
PF1 (Baseline)	MAF	214 m ³ /sec
PF2	$Q_{max} + MAF$	1988 m ³ /sec
PF3	$Q_{max} + 1S$	2033 m ³ /sec
PF4	$Q_{max} + 3S$	2125 m ³ /sec

MAF = Mean Annual Flow (estimated)

Q_{max} = GLOF discharge

1S = MAF + 1SD (estimated)

3S = MAF + 3SD (estimated) – Assumed to be an extreme event linked with higher precipitation value.

Risk Mapping

Conclusions

- GLOF mapping using geospatial techniques may be helpful
 - to develop a capacity of DM authorities to
 - develop early warning systems in the vulnerable areas.
 - respond and recover from emergency and disaster events

Greater capacity to face these disasters also reduces their impacts
